Introduction. Diet has been demonstrated to have a considerable effect on the composition of the gut microbiota throughout the human lifespan (Sonnenburg et al., 2016). Different human populations can have vastly different intestinal microbiomes, and changes in diet lead to changes in microbiota composition (Maslowski and Mackay, 2011). Owing to the essential role of the gut microbiota in ... Thoracic tumor, especially lung cancer, ranks as the top cancer mortality in most parts of the world. Lung adenocarcinoma is the predominant subtype and there is increasing knowledge on therapeutic molecular targets, namely EGFR, ALK, KRAS, and ROS1, among lung cancers. An overview of epigenetic agents and natural nutrition products targeting DNA methyltransferase, histone deacetylases and microRNAs. A functional assay for microRNA target identification and validation. MicroRNAs (miRNA) are a class of small RNA molecules that regulate numerous critical cellular processes and bind to partially complementary sequences resulting in down-regulation of their target gene...
